

# ABBYY FlexiCapture® 9.0

## Key New Features

### High Scalability

FlexiCapture 9.0's robust server-based architecture ensures fast and reliable processing—regardless of document size or volume.

### Remote Stations

Remote access to the system allows the data-capture process to be distributed among multiple devices for greater productivity including:

- Remote Scanning Station
- Web-based Remote Administration and Monitoring Console

### Redaction

Remove confidential data from documents intended for public use. FlexiCapture's new redaction feature allows sensitive data to be manually or automatically blacked-out.

### Multi-level Classifier

Critical for efficiency, this classifier processing enables various types of documents to be used in a single batch. ABBYY's new classification technology optimizes document assembly and identification.

### New Recognition Languages

FlexiCapture 9.0 now enables fast and accurate processing of documents in Chinese (simplified and traditional), Japanese, Korean, and Vietnamese.

### Multiple Destination Export

Data and images can be simultaneously exported to multiple destinations in the desired format. One export action can supply the back-end application with data and the ECM system with indexed images.

### Web-service API

FlexiCapture's automated document classification and data capture service can be smoothly integrated into existing business processes and workflow via SOAP.

## Known Issues

1. Batch Type export settings are not applied during export. In order to specify export destination, Document Definition export settings should be used. Make sure to change default export path in Document Definition to the correct one in the UNC format.
2. **Port 80:** FlexiCapture web services use port 80 for product operations. In case other services use the same port, some issues may occur. Workaround: switch conflicting services to ports other than 80.
3. The Monitoring Operator cannot send a batch or tasks to specific processing stages. It can be done by the Senior Verificator on the Verification Station.
4. The user rights displayed on the user's page don't include inherited rights from any group membership.
5. When several operators try to get a task from the same queue, some may receive the message «**No active tasks**». This message can also appear if another user gets the task you were requesting, so please try again.

# Release Notes

6. It is not possible to turn off the option “**Check Hot Folder every...**” for an inaccessible Hot Folder. However, because Processing Stations try to import from this Hot Folder, it can fail due to an inaccessible correspondent tab. The solution is to delete this profile.
7. After importing images from the Hot Folder (including subfolders) and moving them successfully to the processed folder, the images are stored in this folder together without maintaining the structure.
8. The displayed number of recognized characters is a little higher than the real number of recognized symbols. The statistics of symbols for verification incorporates the statistics for uncertain characters. (For example, fields marked for obligatory verification are also added to the statistics of uncertainly recognized characters).
9. In “**Unattended Mode**”, when the option “**Delete documents after export**” is on, the documents are always deleted—even if the export was not successful.
10. When the <**Unprocessed**> documents skip verification option “**Skip verification and data verification if percentage of uncertain characters is equal or less then...**” is selected, documents go to the export stage, where the export fails, and then they go to exceptions. These documents should go directly to the exception stage.
11. If one of the documents from the group cannot be exported, the entire group goes to the exceptions. If the option “**Export entire batches**” is off, only the documents which couldn't be exported should go to the exception stage, and the others should have a processed status.
12. If a Processing Station stops and the export task goes from this station to another one, the documents are exported 2 times.
13. The user can connect to an existing Database (which was used previously with some of the File Storage). If the user forgets to specify the File Storage, or types the wrong name of the Storage, no error will be displayed, and the connection to the Database will be successful. But when the user tries to open the project, an error will occur in “**Unable to access Project's options** ('http://baikal-2/40190958-5A70-4A68-A612-3DCFAB80757C/SingleEntryPoint')”. This object is corrupt.
14. When the SQL Server is installed on computer A, and the Application Server, on computer B, it is not possible to create a Database from computer C using Windows-authentication.
15. No warning message is displayed when the storage is full. If your Database is full you can create a new one or address to our technical support. To avoid this situation please use the SQL server without size limitation or use file storage.
